

V6 Implemented — Illustrated Guide of What Was Done

For Rick & Hal — English version — 5 new images

Status: V6 Approved by Rick & Hal → **Implemented and verified end-to-end in production**

(hoamanager26) **Real test case:** Resident 001007, historical void of APR083126 - 12381556, batch BATCH-1788352625889-kkni3 COMPLETED

Point 1 — DDL V6 created in production

Analogy: Before moving any money, we built the **4 new filing cabinets** where all historical-void information now lives.

- **AssessmentPaymentSource** — the **immutable** cabinet: stores what the operator originally entered (amount, whether it came from the SA or AD box). Never rewritten; only flips to **VOID**.
- **APRRecalculationBatch** — the **audit file** for every replay (with **MgtCoClientID/HOALicenseNumber** — HOA-client isolation).
- **ResidentCreditLedger** — the **credit notebook** with **EventDate** (original economic date, not the replay date) and **Status** POSTED/SUPERSEDED.
- **AssessmentPaymentRegister** — gained **lineage** columns: **SubmissionKey**, **RecalcBatchID**, **ReplacesAPRTransactionID**, **SupersededAt**.

V6 Implementation Step 1 — DDL Created in Production Database

✓ CREATED IN PRODUCTION

AssessmentPaymentSource

immutable

- TransactionNumber — unique
- SubmissionKey
- OriginalEntryType — SA / AD
- OriginalAmount
- Status — POSTED / VOID

✓ CREATED IN PRODUCTION

APRRecalculationBatch

audit header

- BatchID
- MgtCoClientID
- HOALicenseNumber — tenant
- Status — COMPLETED

✓ CREATED IN PRODUCTION

ResidentCreditLedger

- EventDate — calendar
- Status — POSTED / SUPERSEDED
- SupersededAt

✓ CREATED IN PRODUCTION

AssessmentPaymentRegister — ALTER

+ ALTER

- new columns:
- SubmissionKey
 - RecalcBatchID
 - ReplacesAPRTransactionID
 - SupersededAt

✓ CREATED IN PRODUCTION

Point 2 — Deterministic backfill: 19 APR rows → 17 Source rows

Analogy: We copied the **original intent** of every historical payment into the immutable cabinet, grouping by exact **TransactionNumber** — like filing invoices by invoice number, **not by "similar date and amount"**.

- 19 physical rows in AssessmentPaymentRegister → **17 distinct business transactions** → **15 POSTED rows** in AssessmentPaymentSource (the remaining 2 were already VOID and intentionally excluded).
- Each SubmissionKey = TransactionNumber (1 to 1). The resident+date+amount heuristic is forbidden — anything that doesn't match exactly goes to manual review.

V6 Implementation Step 2 — Deterministic Backfill: 19 APR rows to 17 Source rows

Backfill complete in production

**resident+date+amount matching
FORBIDDEN**

Point 3 — F1–F4 fixes in the Void code

Analogy: The old void was like a teller who, when cancelling an invoice, refunded **only the first receipt** and also **crossed out calendar lines**. Fixed:

- **F1** — Before: reversed only rows [0]; now reverses **all rows** of the transaction (a \$500 SA + \$100 AD transaction reverses the full \$600).
- **F2** — Before: decremented PeriodAmount (the obligation schedule); now the **schedule is never touched**.
- **F3** — Before: credit stayed inflated; now ResidentCreditBalance is **recomputed from the Ledger** (POSTED only, with tenant MgtCo/HOA — the detail Rick flagged).
- **F4** — Before: the whole CashFlow receipt was voided even when voiding only part; now **only the voided transaction's cash lines are voided**.

V6 Implementation Step 3 — F1-F4 Void Bug Fixes

ITEM	 BEFORE	 AFTER
F1	reversed only first row rows[0]	reverses ALL rows of transaction
F2	void decremented PeriodAmount schedule	Period schedule untouched
F3	ResidentCreditBalance never reversed on void	credit recomputed from Ledger with tenant MgtCo/HOA
F4	CashFlow keyed to first TransactionNumber, whole receipt voided	only voided transaction cash lines voided, replayed receipts untouched

VOID BUG FIXES • V6 • STEP 3

Point 4 — Real historical void executed and verified (001007)

Analogy: We erased **the resident's entire fiscal-year book** and reprinted it from January, using the **bank that was effective on each date** — not today's bank.

Real case: Void of APR083126 - 12381556 (2 rows: SA \$264.23 + AD \$36.54) on resident 001007:

Concept	BEFORE	AFTER
Annual Dues	1000/1000 (due 0)	965/1000 (due 35)
Special Assessment	500/500 (due 0)	235.77/500 (due 264.23)
Resident Credit	1.54	0
APR rows	12 active	12 SUPERSEDED + 10 re-POSTED

- **F1 verified:** both rows of the voided transaction were **SUPERSEDED** — the reversal is complete.
- **F3 verified:** the old 1.54 credit correctly disappears — without the voided transaction's overflow, the \$700 payment covers Annual Dues in full (700 vs 698.46+1.54 before).
- Batch BATCH- 1788352625889 - kkn13 **COMPLETED** with tenant, 10 transactions replayed.

V6 Implementation Step 4 — Real Historical Void Executed: Resident 001007, Voided APR083126-12381556

(2 rows: SA 264.23 + AD 36.54)

BEFORE

AnnualDues
Paid 1000/1000
Due 0

SpecialAssessment
Paid 500/500
Due 0

Resident Credit
1.54

VOID + FULL-YEAR REPLAY from immutable Source — Batch
BATCH-1788352625689-kkni3 COMPLETED, 12 old rows SUPERSEDED, 10 rows re-POSTED

AFTER

AnnualDues
Paid 965/1000
Due 35

SpecialAssessment
Paid 235.77/500
Due 264.23

Resident Credit
0

money without voided overflow now covers AD fully: 700 applied vs 698.46+1.54 before

audit batch COMPLETED with tenant

Point 5 — CashFlow per BankID: only the voided transaction's cash is voided

Analogy: 7 separate physical checkbooks (one per real bank). When voiding a payment, only the receipt in the checkbook where that money landed is crossed out — the other checkbooks never notice.

- 6 physical tables created: CashFlow_BankID_101/201/301/401/451/501 (V6 transactional structure with SubmissionKey, CashInAmount, RecalcBatchID).
- **Rick's rule applied:** the replay **never re-posts CashFlow** — the money did not move again.
- Verified: CF for 12381556 (300.77) → VoidFlag=Y; CF for replayed 12441098 (700) → untouched (VoidFlag=N).
- Active cash per bank always equals the still-valid portion of the payment.

V6 Implementation Step 5 – CashFlow Per BankID: Only Voiced Transaction Cash Voiced

 CashFlow_BankID_101 Operating PROVISIONED	 CashFlow_BankID_201 Capital PROVISIONED	 CashFlow_BankID_301 Escrow PROVISIONED	 CashFlow_BankID_401 MoneyMarket PROVISIONED	 CashFlow_BankID_451 Savings PROVISIONED	 CashFlow_BankID_501 CD PROVISIONED
--	--	---	--	--	---

active cash per bank always equals still-valid portion

Final state and next step

Item	Status
DDL V6 in production	☐ Created and verified
Deterministic backfill	☐ 15 Source rows (2 VOID excluded on purpose)
F1-F4 fixes	☐ In code and verified in a real test
Historical full-year void	☐ Executed: batch COMPLETED, 10 transactions replayed
CashFlow per BankID	☐ 6 tables provisioned + replay rule applied
Next step	Controlled end-to-end testing by Rick & Hal — we are ready when you are
